

High Performance Glazing Solutions for Conservatories

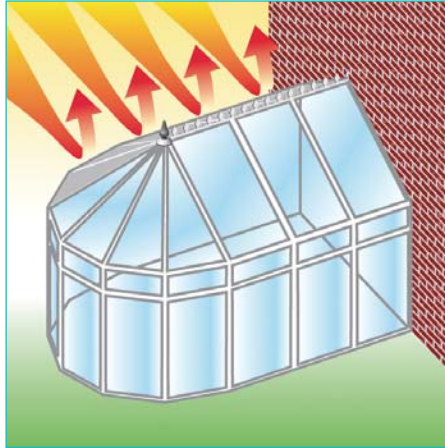

- Reflects heat in summer
- Retains heat in winter
- Minimises glare from sunlight
- Reduces bleaching from the sun
- True self-cleaning glass

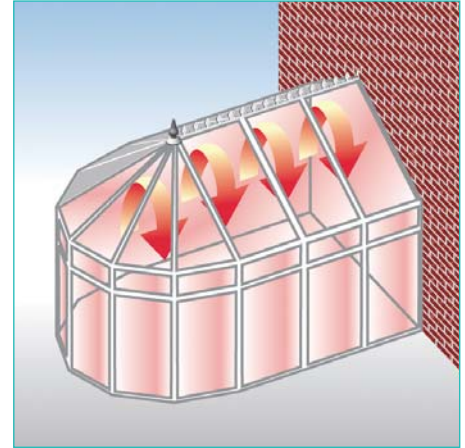

HEAT INSULATION

- **Twice as much solar heat reflection** is provided by these Ecosave Comfort+ units compared to standard double glazed units, thanks to the advanced solar control performance of this glass combination.
- **More than double the level of heat insulation** is offered when compared to standard double glazed units, due to the advanced technology low-E glass incorporated within the unit.

Cooler in summer

Reduces overheating, glare and fading of furniture.

Warmer in winter

Retains more heat in winter enabling year-round use.

ENHANCED VISION AREA AND REDUCED GLARE

- The **dramatically improved vision area** is a key advantage of glass conservatory roofing over polycarbonate roofing. The attractive natural tint of the Ecosave Comfort+ range also significantly reduces glare from the sun.

Normal Glass

Self-cleaning Glass

SOUND INSULATION

- **100% noise reduction compared to polycarbonate roofs** is offered by the basic Ecosave Comfort+ unit. This benefit is particularly noticeable when it is raining. When combined with acoustically laminated conservatory wall units, road traffic, airplane and railway noise is significantly reduced.

UV PROTECTION

- The **bleaching effect of the sun is reduced** because 83% of UV rays are blocked.

- **Actively breaks down organic dirt**
- **Water sheets across its surface to wash dirt away**
- **Clear vision even when it's raining**
- **Dirty water droplet marks are all but eliminated**
- **No need to re-apply the self-cleaning coating**

DUAL ACTION SELF-CLEANING GLASS

- Every Ecosave Comfort+ unit incorporates true, dual action self-cleaning glass, which breaks down dirt and washes it away as illustrated in the diagrams on the left.

Since the water does not form into droplets on its surface, this means that **you can see clearly out of your windows even when it is raining.**

Additionally, when the water evaporates it **doesn't leave behind the usual dirty water droplet marks.** The result is that windows stay cleaner for longer!

The self-cleaning coating is also applied as the glass is actually being manufactured. This means that it is fused into the surface and therefore lasts the lifetime of the pane of glass, unlike the spray on 'easy-clean' coatings which wear off after a period of time and need to be re-applied.
